IMPORTANT SAFETY NOTICE

Proper service and repair is important to the safe, reliable operation of all Philips Consumer Electronics Company** Equipment. The service procedures recommended by Philips and described in this service manual are effective methods of performing service operations. Some of these service operations require the use of tools specially designed for the purpose. The special tools should be used when and as recommended.

It is important to note that this manual contains various **CAUTIONS** and **NOTICES** which should be carefully read in order to minimize the risk of personal injury to service personnel. The possibility exists that improper service methods may damage the equipment. It also is important to understand that these **CAUTIONS** and **NOTICES ARE NOT EXHAUSTIVE**. Philips could not possibly know, evaluate and advise the service trade of all conceivable ways in which service might be done, or of the possible hazardous consequences of each way. Consequently, Philips has not undertaken any such broad evaluation. Accordingly, a servicer who uses a service procedure or tool which is not recommended by Philips must first satisfy himself thoroughly that neither his safety nor the safe operation of the equipment will be jeopardized by the service method selected.

** Hereafter throughout this manual, Philips Consumer Electronics Company will be referred to as Philips.

WARNING

Critical components having special safety characteristics are identified with a  or "S" by the Ref. No. in the parts list and enclosed within a broken line* (where several critical components are grouped in one area) along with the safety symbol  on the schematics or exploded views. Use of substitute replacement parts which do not have the same specified safety characteristics may create shock, fire, or other hazards. Under no circumstances should the original design be modified or altered without written permission from Philips. Philips assumes no liability, express or implied, arising out of any unauthorized modification of design. Servicer assumes all liability.

* **Broken Line** _____

FIRE AND SHOCK HAZARD

1. Be sure all components are positioned in such a way as to avoid the possibility of adjacent component shorts. This is especially important on those chassis which are transported to and from the service shop.
2. Never release a repaired unit unless all protective devices such as insulators, barriers, covers, strain reliefs, and other hardware have been installed in accordance with the original design.
3. Soldering and wiring must be inspected to locate possible cold solder joints, solder splashes, sharp solder points, frayed leads, pinched leads, or damaged insulation (including the ac cord). Be certain to remove loose solder balls and all other loose foreign particles.
4. Check across-the-line components and other components for physical evidence of damage or deterioration and replace if necessary. Follow original layout, lead length, and dress.
5. No lead or component should touch a receiving tube or a resistor rated at 1 watt or more. Lead tension around protruding metal surfaces or edges must be avoided.
6. Critical components having special safety characteristics are identified with an 'S' by the Ref. No. in the parts list and enclosed within a broken line* (where several critical components are grouped in one area) along with the safety symbol  on the schematic diagrams and /or exploded views.
7. When servicing any unit, always use a separate isolation transformer for the chassis. Failure to use a separate isolation transformer may expose you to possible shock hazard, and may cause damage to servicing instruments.
8. Many electronic products use a polarized ac line cord (one wide pin on the plug). Defeating this safety feature may create a potential hazard to the servicer and the user. Extension cords which do not incorporate the polarizing feature should never be used.
9. After reassembly of the unit, always perform an ac leakage test or resistance test from the line cord to all exposed metal parts of the cabinet. Also, check all metal control shafts (with knobs removed), antenna terminals, handles, screws, etc., to be sure the unit may be safely operated without danger of electrical shock.

* **Broken line** _____

LEAKAGE CURRENT COLD CHECK

1. Unplug the ac line cord and connect a jumper between the two prongs of the plug.
2. Turn on the power switch.
3. Measure the resistance value between the jumpered ac plug and all exposed cabinet parts of the receiver, such as screw heads, antennas, and control shafts. When the exposed metallic part has a return path to the chassis, the reading should be between 1 megohm and 5.2 megohms. When the exposed metal does not have a return path to the chassis, the reading must be infinity. Remove the jumper from the ac line cord.

LEAKAGE CURRENT HOT CHECK

1. Do not use an isolation transformer for this test. Plug the completely reassembled receiver directly into the ac outlet.
2. Connect a 1.5k, 10W resistor paralleled by a 0.15uF. capacitor between each exposed metallic cabinet part and a good earth ground such as a water pipe, as shown below.
3. Use an ac voltmeter with at least 5000 ohms/volt sensitivity to measure the potential across the resistor.
4. The potential at any point should not exceed 0.75 volts. A leakage current tester may be used to make this test; leakage current must not exceed 0.5mA. If a measurement is outside of the specified limits, there is a possibility of shock hazard. The receiver should be repaired and rechecked before returning it to the customer.
5. Repeat the above procedure with the ac plug reversed. (Note: An ac adapter is necessary when a polarized plug is used. Do not defeat the polarizing feature of the plug.)

OR

With the instrument completely reassembled, plug the ac line cord directly into a 120Vac outlet. (Do not use an isolation transformer during this test.) Use a leakage current tester or a metering system that complies with American National Standards Institute (ANSI) C101.1 Leakage Current for Appliances and Underwriters Laboratories (UL) 1410, (50.7). With the instrument ac switch first in the on position and then in the off position, measure from a known earth ground (metal water pipe, conduit, etc.) to all exposed metal parts of the instrument (antennas, handle brackets, metal cabinet, screw heads, metallic overlays, control shafts, etc.), especially any exposed metal parts that offer an electrical return path to the chassis. Any current measured must not exceed 0.5mA. Reverse the instrument power cord plug in the outlet and repeat the test. See the graphic below.

TV SAFETY NOTES

SAFETY CHECKS

After the original service problem has been corrected, a complete safety check should be made. Be sure to check over the entire set, not just the areas where you have worked. Some previous servicer may have left an unsafe condition, which could be unknowingly passed on to your customer. Be sure to check all of the following:

- Fire and Shock Hazard
- Implosion
- X-Radiation
- Leakage Current Cold Check
- Leakage Current Hot Check
- Picture Tube Replacement
- Parts Replacement

WARNING: Before removing the CRT anode cap, turn the unit OFF and short the HIGH VOLTAGE to the CRT DAG ground.

SERVICE NOTE: The CRT DAG is not at chassis ground.

IMPLOSION

1. All picture tubes used in current model receivers are equipped with an integral implosion system. Care should always be used, and safety glasses worn, whenever handling any picture tube. Avoid scratching or otherwise damaging the picture tube during installation.
2. Use only replacement tubes specified by the manufacturer.

X-RADIATION

1. Be sure procedures and instructions to all your service personnel cover the subject of X-radiation. Potential sources of X-rays in TV receivers are the picture tube and the high voltage circuits. The basic precaution which must be exercised is to keep the high voltage at the factory recommended level.
2. To avoid possible exposure to X-radiation and electrical shock, only the manufacturer's specified anode connectors must be used.
3. It is essential that the service technician has an accurate HV meter available at all times. The calibration of this meter should be checked periodically against a reference standard.
4. When the HV circuitry is operating properly there is no possibility of an X-radiation problem. High voltage should always be kept at the manufacturer's rated value - no higher - for optimum performance. Every time a color set is serviced, the brightness should be run up and down while monitoring the HV with a meter to be certain that the HV is regulated correctly and does not exceed the specified value. We suggest that you and your technicians review test procedures so that HV and HV regulation are always checked as a standard servicing procedure, and the reason for this prudent routine is clearly understood by everyone. It is important to use an accurate and reliable HV meter. It is recommended that the HV reading be recorded on each customer's invoice, which will demonstrate a proper concern for the customer's safety.

5. When troubleshooting and making test measurements in a receiver with a problem of excessive high voltage, reduce the line voltage by means of a Variac to bring the HV into acceptable limits while troubleshooting. Do not operate the chassis longer than necessary to locate the cause of the excessive HV.
6. New picture tubes are specifically designed to withstand higher operating voltages without creating undesirable X-radiation. It is strongly recommended that any shop test fixture which is to be used with the new higher voltage chassis be equipped with one of the new type tubes designed for this service. Addition of a permanently connected HV meter to the shop test fixture is advisable. The CRT types used in these new sets should never be replaced with any other types, as this may result in excessive X-radiation.
7. It is essential to use the specified picture tube to avoid a possible X-radiation problem.
8. Most TV receivers contain some type of emergency "Hold Down" circuit to prevent HV from rising to excessive levels in the presence of a failure mode. These various circuits should be understood by all technicians servicing them, especially since many hold down circuits are inoperative as long as the receiver performs normally.

PICTURE TUBE REPLACEMENT

The primary source of X-radiation in this television receiver is the picture tube. The picture tube utilized in this chassis is specially constructed to limit X-radiation emissions. For continued X-radiation protection, the replacement tube must be the same type as the original, including suffix letter, or a Philips approved type.

PARTS REPLACEMENT

Many electrical and mechanical parts in Philips television sets have special safety related characteristics. These characteristics are often not evident from visual inspection nor can the protection afforded by them necessarily be obtained by using replacement components rated for higher voltage, wattage, etc. The use of a substitute part which does not have the same safety characteristics as the Philips recommended replacement part shown in this service manual may create shock, fire, or other hazards.

PRODUCT SAFETY GUIDELINES FOR ALL PRODUCTS

CAUTION: Do not modify any circuit. Service work should be performed only after you are thoroughly familiar with all of the following safety checks. Risk of potential hazards and injury to the user increases if safety checks are not adhered to.

USE A SEPARATE ISOLATION TRANSFORMER FOR THIS UNIT WHEN SERVICING.

PREVENTION OF ELECTROSTATIC DISCHARGE (ESD)

Some semiconductor solid state devices can be damaged easily by static electricity. Such components commonly are called Electrostatically Sensitive (ES) Devices, Examples of typical ES devices are integrated circuits and some field-effect transistors and semiconductor "chip" components. The following techniques should be used to help reduce the incidence of component damage caused by electrostatic discharge (ESD).

1. Immediately before handling any semiconductor component or semiconductor-equipped assembly, drain off any ESD on your body by touching a known earth ground. Alternatively, obtain and wear a commercially available discharging ESD wrist strap, which should be removed for potential shock reasons prior to applying power to the unit under test.
2. After removing an electrical assembly equipped with ES devices, place the assembly on a conductive surface such as aluminum foil, to prevent electrostatic charge buildup or exposure of the assembly.
3. Use only a grounded-tip soldering iron to solder or unsolder ES devices.
4. Use only an anti-static solder removal device. Some solder removal devices not classified as "antistatic (ESD protected)" can generate an electrical charge sufficient to damage ES devices.
5. Do not use Freon propelled chemicals. These can generate electrical charges sufficient to damage ES devices.
6. Do not remove a replacement ES device from its protective package until immediately before you are ready to install it (most replacement ES devices are packaged with leads electrically shorted together by conductive foam, aluminum foil or comparable conductive material).
7. Immediately before removing the protective material from the leads of a replacement ES device, touch the protective material to the chassis or circuit assembly into which the device will be installed.

CAUTION: Be sure no power is applied to the chassis or circuit and observe all other safety precautions.

8. Minimize bodily motions when handling unpackaged replacement ES devices. (Otherwise harmless motion such as the brushing together of your clothes fabric or the lifting of your feet from a carpeted floor can generate static electricity (ESD) sufficient to damage an ES device.)

NOTE to CATV system Installer:

This reminder is provided to call the CATV system installer's attention to article 820-22 of the NEC that provides guidelines for proper grounding and, in particular, specifies that the cable ground shall be connected to the grounding system of the building, as close to the point of cable entry as practical.

PRACTICAL SERVICE PRECAUTIONS

IT MAKES SENSE TO AVOID EXPOSURE TO ELECTRICAL SHOCK. While some sources are expected to have a possible dangerous impact, others of quite high potential are of limited current and are sometimes held in less regard.

ALWAYS RESPECT VOLTAGES. While some may not be dangerous in themselves, they can cause unexpected reactions – reactions that are best avoided. Before reaching into the powered color TV set, it is best to test the high voltage insulation. It is easy to do, and is just a good service precaution.

BEFORE POWERING UP THE TV WITH THE BACK OFF (or on a test fixture), attach a clip lead to the CRT DAG ground and to a screwdriver blade that has a well insulated handle. After the TV is powered on and high voltage has developed, probe the anode lead with the blade, starting at the bottom of the High Voltage Transformer (flyback – IFT). Move the blade to within two inches of the connector of the CRT. **IF THERE IS AN ARC, YOU FOUND IT THE EASY WAY, WITHOUT GETTING A SHOCK!** If there is an arc to the screwdriver blade, replace the High Voltage Transformer or the lead, (if removable) whichever is causing the problem.

PICTURE TUBE REPLACEMENT PROCEDURE

Note: a. Two (2) people are required to handle this picture tube.
b. Safety Glasses must be worn during this procedure or whenever directly handling a picture tube.
c. Take care in each step not to damage the CRT or the cabinet.

1. Remove the Chassis and the CRT Socket Board Module from the cabinet.
2. A furniture pad or blanket should be positioned on the floor to support only the CRT Face. This pad or blanket should be high enough to keep the CRT Face approximately 12 to 14 inches off the floor.
3. Using two people, place the cabinet in a front down position with the CRT Face on the pad or blanket.
4. Place padded blocks under each corner of the cabinet to keep it from rocking.
5. Remove the four screws, at the corners of the CRT.
6. With two people lowering the cabinet to the floor, leave the CRT elevated by the pad or blanket.

Note: Take care not to grasp the neck of the CRT during this procedure, as it is extremely fragile.

7. Two (2) people may then lift the CRT from the cabinet.
8. Remove the degaussing coil from the defective CRT and mount on the replacement. Take care to maintain the exact shape and fit.

To install the new CRT, reverse steps 1 to 7.

Safety Instructions - Resolder Notice

1 Safety regulations require that during a repair:

- the set should be connected to the mains via an isolating transformer
- safety components, indicated by the symbol:  should be replaced by components identical to the original ones
- when replacing the CRT, safety goggles must be worn

2 Safety regulations require that after a repair the set must be returned in its original condition. In particular, attention should be paid to the following points:

Note:

This resoldering is advised to prevent bad connections due to metal fatigue in solder joints, and is therefore only necessary for television sets older than 2 years.

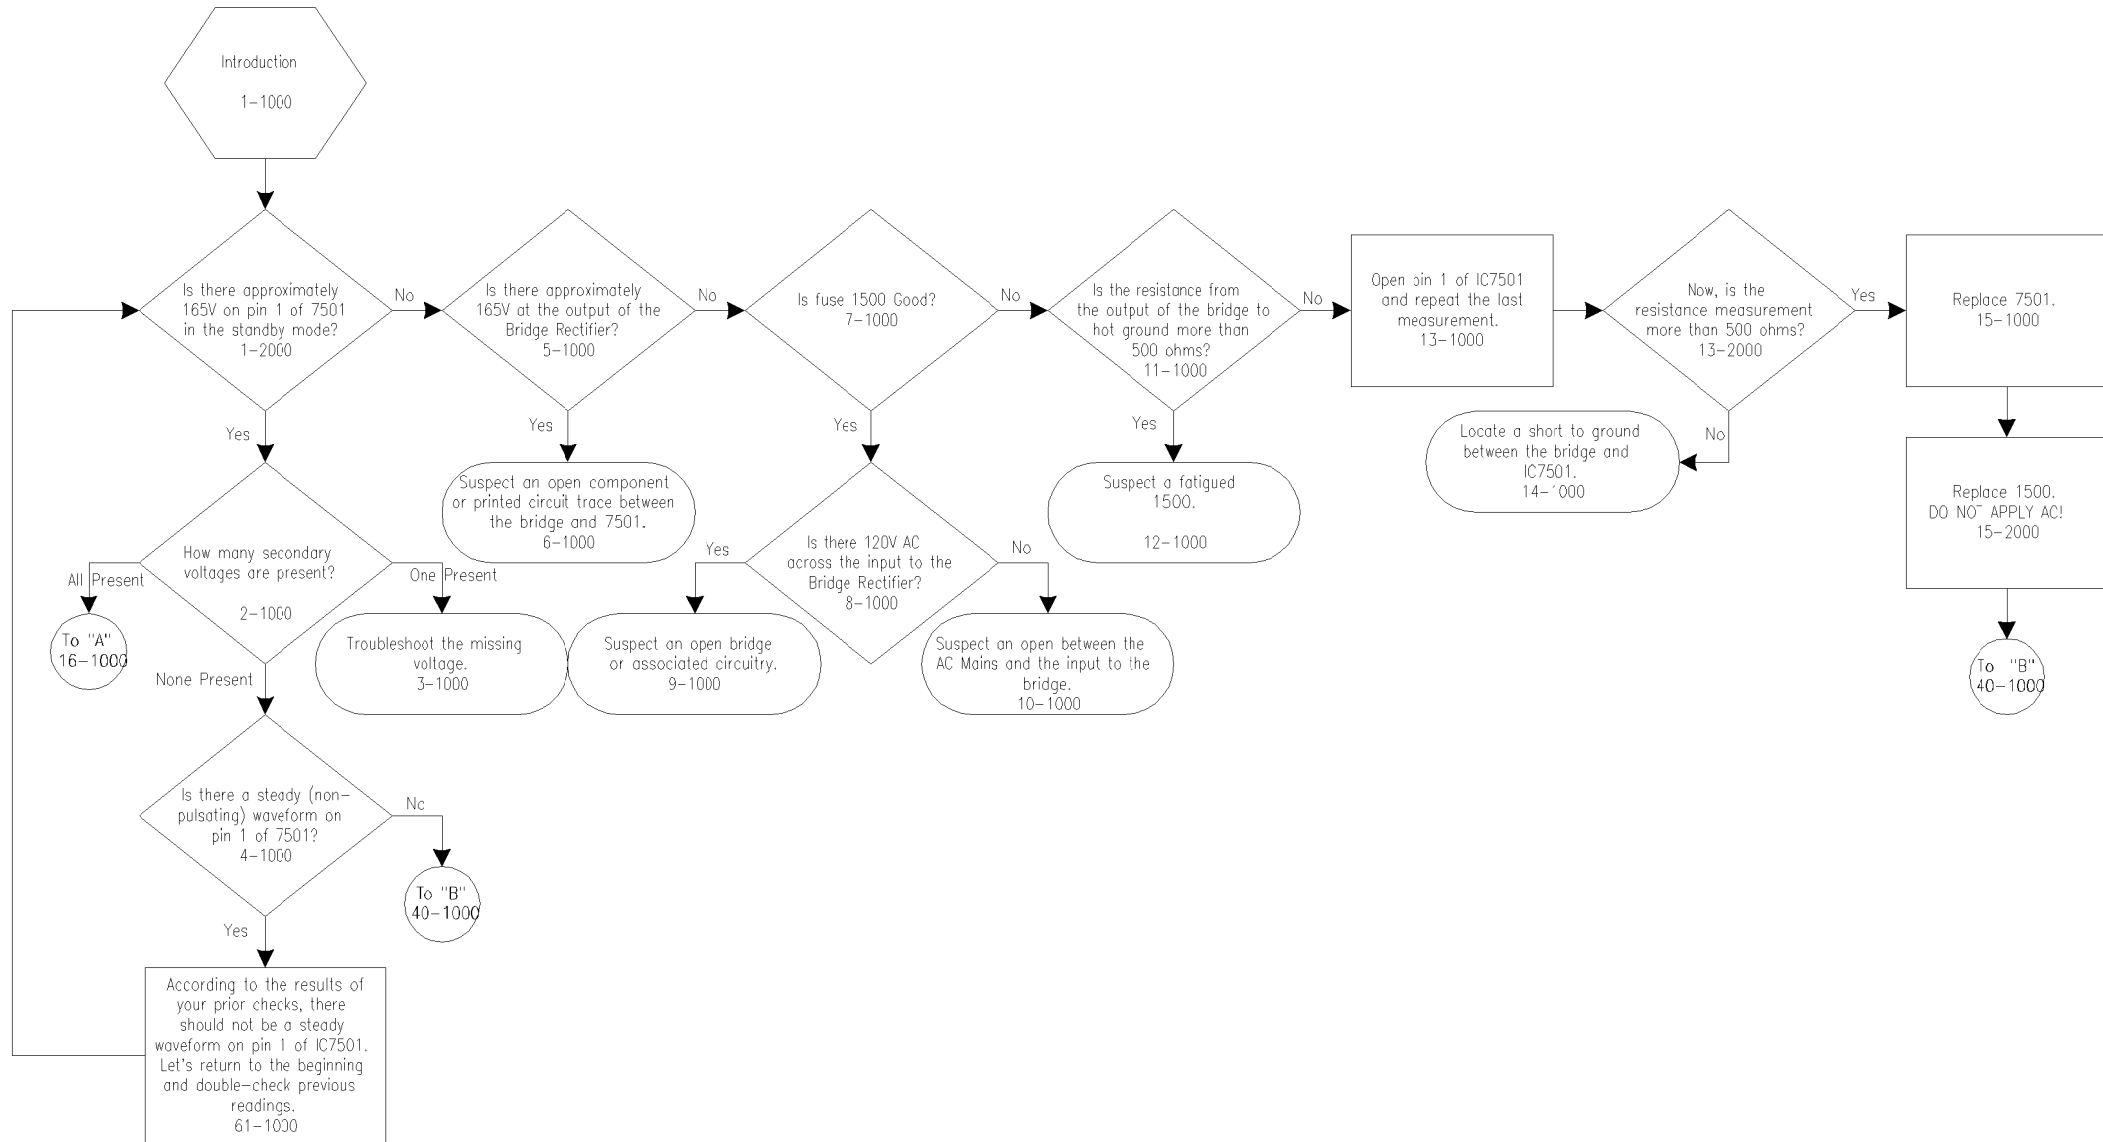

- As a strict precaution, we advise you to resolder the solder joints through which the horizontal deflection current is flowing, in particular:
 - All pins of the line output transformer (LOT)
 - flyback capacitor(s)
 - S-correction capacitor(s)
 - line output transistor
 - pins of the connector with wires to the deflection coil
 - other components through which the deflection current flows
- Resolder points are marked by a white circle on the bottom of the CBA.
- The wire trees and EHT cable should be routed correctly and fixed with the mounted cable clamps.
- The insulation of the mains lead should be checked for external damage.
- The mains lead strain relief should be checked for its function in order to avoid touching the CRT, hot components or heat sinks.
- The electrical DC resistance between the mains plug and the secondary side should be checked (only for sets which have a mains isolated power supply).
This check can be done as follows:
 - unplug the mains cord and connect a wire between the two pins of the mains plug
 - set the mains switch to the on position (keep the mains cord unplugged!)
 - measure the resistance value between the pins of the mains plug and the metal shielding of the tuner or the aerial connection on the set. The reading should be between 4.5 Megohm and 12 Megohm.
 - switch off the TV and remove the wire between the two pins of the mains plug
- The cabinet should be checked for defects to avoid touching of any inner parts by the customer.

This test will prevent premature destruction of the parts that have just been changed or will allow observation of the power supply without applying AC voltage.
Apply an external DC power supply between the cathode of 6507 and "hot ground" (positive lead to the cathode). Now, place a clip lead from the cathode to the positive lead of capacitor 2503. Slowly increase the voltage until you measure 20 volts on pin 4 of IC7501. At that point, decrease the voltage to approximately 18 volts.
40-1000

Is there a waveform on pin 1 of 7501? This waveform will not look exactly as shown due to being operated with a DC power source.
40-2000

No
Suspect components associated with 7501. Select "Page Up" for hint on checking Opto-Isolator.
44-1000

Troubleshoot the low or missing voltage(s). Note: if both voltages are low, suspect the feedback circuitry.
45-1000

Yes
Remove the external DC power supply. Set a variac at 60V AC. Plug the set into the variac and check the secondary voltages. DO NOT TURN THE SET ON YET!

J8 CHASSIS SERVICE ADJUSTMENTS

Service Adjustment Notes:

REQUIRED TOOLS FOR SERVICING

Isolation Transformer
Multimeter
Oscilloscope
High Voltage (100:1) Oscilloscope Probe
Sencore VG91 Universal Video Generator

Caution: The J8 chassis incorporates a "hot" ground system. Always use a separate isolation transformer when applying power to the exposed chassis.

Unless Otherwise Specified:

1. All service adjustments are "hot" voltagewise. For maximum safety, ensure the use of properly insulated tools.
2. Refer to the J8 Main Chassis Printed Circuit Board for location of test points and adjustable components.
3. Grid Locations (Ex.: D-3) next to the reference numbers for components refer to the Main Chassis Printed Circuit Board.

Focus Adjustment

1. Tune the set to a local or cable station.
2. Adjust the Focus Control (located on the upper part of the flyback transformer) for best picture details at high light conditions.

Degaussing the Television

1. Position the television so that the screen faces the direction it will be facing when in use.
2. Ensure the set is turned off.
3. Move a degaussing coil in a circular motion slowly around the sides and front of the set.
4. Continue this motion while withdrawing the degaussing coil at least six feet from the television, and then disconnect the degaussing coil from its power source.

Service mode

Introduction

The service mode is a combined Service Default Mode (SDM) and Service Alignment Mode (SAM). This service mode is Called SDAM. When the television is in SDAM, all normal features (such as volume control and direct channel access) are available. In service mode there will be an "S" displayed (in green) at the top right of the screen. All other Service OSD's will also be in green.

Error buffer

Error codes will indicate failures in the television.

A unique error code is available for:

- activated protection
- failing I²C device
- general I²C error
- RAM failure (e.g. internal RAM of microprocessor)

Other error codes are:

- Video Chip start-up failure

The last five errors, stored in the NVM, are shown in the service menu. This is called the error buffer.

An error code will be added to the buffer if it differs from the last error detected.

If errors occur simultaneously, and the codes for these errors differ from the errors currently on screen, the display will be updated to reflect this change.

The error that is found last is displayed on the left. The error code to the right should be used to solve a multiple error fault. If an intermittent fault occurs refer to the stored error code.

Example:

Suppose the display shows: 7 5 2 0 0

In this case, the last error detected was a Stereo I²C error.

A seven (7) appears at the 1st position (on the left), and pushes the previous error(s) detected one space to the right.

The following error codes have been defined:

0 = No error

1 = Master Protect (Master Protect, Monitors Beam Current/Xray(6732), 8v LOT(6730), 25v LOT(6731), vertical(6755), tuner 5v (6733), these diodes will pull pin 26 of micro 7600 low and shut off TV.

A one (1) will be stored after the fault is cleared.)

2 = I²C error while communicating with a processor

3 = General I²C error (*)

4 = Internal RAM error micro controller

5 = I²C error EEPROM error

6 = I²C error PLL tuner

7 = Stereo I²C error

Note: I²C =(SCL/SDA)

(*) General I²C error means: no I²C device is responding to the particular I²C bus.

Possible causes:

SCL Short circuit to GND, SDA Short Circuit to GND, SCL Short Circuit to SDA, SDA Open Circuit (at uP pin), SCL Open Circuit (at uP pin)

Cause and Effect

In case a failure identified by an error code automatically results in other error codes (cause and effect), only the error code of the MAIN failure will be displayed. Example: In case of a failure of the I²C bus (CAUSE), the error code for a „general I²C failure“ will be displayed. The error codes for the single devices (EFFECT) won't be displayed.

NVM replacement or Defective NVM

After replacing a NVM (or with a defective/no NVM) default settings will be used that enable the set to start up and that allow access to the Service „SDAM“ Mode.

Service unfriendly modes

In the service modes, a number of modes/features are ignored since they interfere with diagnosing or repairing a set. These are „service unfriendly modes.“

„Ignoring“ means that the event that is triggered is not executed, the setting remains unchanged. (Example: Timer OFF: 8:00 PM; the set will not switch OFF in service mode at 8.00PM, but the setting will remain).

These modes are:

- Blue mute.
- Auto switch off (when there is no ident signal).
- Automatic user menu time-out (menu switches back/OFF automatically) except for Surf menu.

Service Mode (SDAM) entry and exit

1. Entering the Service Default Alignment Mode (SDAM) can be achieved in either of the following two ways:
 - a. Press the following key sequence on the remote control transmitter while the set is in Standby mode:
0-6-2-5-9-6-Status (Do not let the sequence time-out between entries)
 - b. Short service pin 0239 (on the CBA) to ground and switch power-on.
2. To select an option menu item in SDAM, use the Menu Up or Menu Down buttons on the remote control.
3. To enter into a sub-menu, press the Menu Right button on the remote control.
4. To change the value of an option code, use the Menu Left or Menu Right buttons.
5. Press the Status button on the remote control to toggle the OSD on and off to prevent the OSD from interfering with measurements and oscilloscope waveforms.
6. Press the Menu button on the remote control while in SDAM to switch the software to a Virtual Customer Mode; the letter "S" will still be displayed in the upper right corner of the screen. In this mode, all customer menu adjustments to the set can be performed. From the Virtual Customer Mode, press the Menu button to return to the SDAM display.
7. To exit the Service Default Alignment Mode and erase the error codes, turn the unit off with the Power button on the remote control, then unplug the ac cord.
8. To exit the Service Default Alignment Mode and save the error codes, unplug the ac cord to turn off the set. Turn the set back on, the Service Default Alignment Mode will still be active. At this point turn the set off using the Power button on the remote control, then unplug the ac cord.

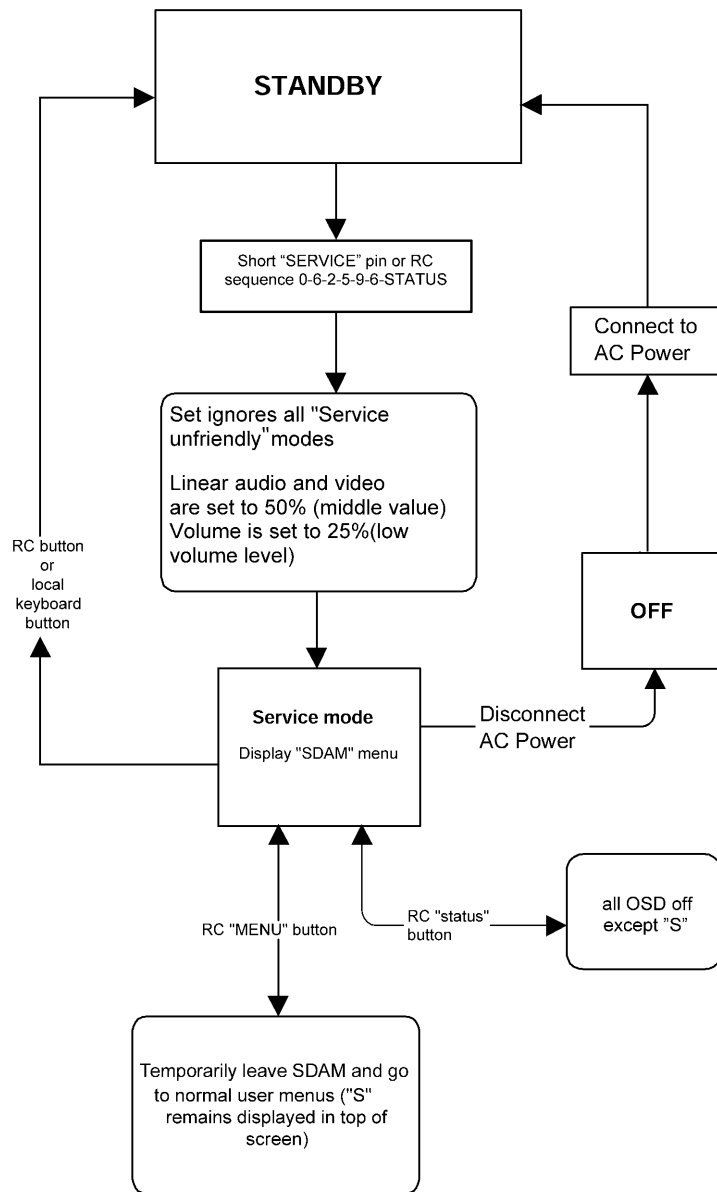

Figure 1 - SDAM Flow Chart

Software identification, version and cluster

The software identification, version and cluster will be shown in the service main menu display.

These numbers consists of the last part of the customer identification printed on the IC package, the screen will show `AAABBC-X.Y`.

- AAA is the engineering project name: L9S
- BB is a function specification indicating specific functionality or a region. Processors with the same engineering project name and function name are interchangeable, except for the languages they support.
- C is the language cluster number within the "BB" software version
- X is the main version number (when release for production "X" will start at „1“)
- Y is the sub version number (when release for production "Y" will start at „0“)
- the main version number is updated with a major change of specification and is incompatible with the previous software version.
- the sub version number is updated with a minor change and is backward compatible with the previous versions.
- if the main version number changes, the new version number is written in the EEPROM.
- if the sub version number changes, the new version number is written in the EEPROM.
- Note: a new micro controller is considered to be compatible if it works instead of the old software and the functionality is not significantly changed.

The following menu will be displayed whenever SDAM is entered. In this menu the error buffer can be viewed, and the option byte(s) can be (re)programmed. The SDAM display is shown below:

When the correct position has been found, place a rubber wedge between the yoke and the CRT. If the yoke is tilted up, place wedge one as shown in Figure 9a; if it is tilted down, place wedge one as shown in Figure 10a.
4. Tilt the yoke to the left and right to find the point of best possible convergence of the red and blue lines at the edges, top and bottom of the screen as [shown in Figure 12](#). When the correct position is located, place wedges two and three as shown in Figure 9b or Figure 10b.
5. Remove wedge one and place it in the final position as shown in [Figure 9c or Figure 10c](#).
6. Use the Menu Up/Down buttons to select Green, and use the Menu Right button to set Green to maximum.
